

U.S.N					

P.E.S. College of Engineering, Mandya - 571 401

(An Autonomous Institution affiliated to VTU, Belgaum)

First Semester, M. Tech - Civil Engineering (MCAD)
Semester End Examination; Jan/Feb. - 2016
Continuum Mechanics-Classical and EF Approach

Time: 3 hrs Max. Marks: 100

Note: i) Answer FIVE full questions, selecting ONE full question from each unit.

ii) If any missing data, Assume suitably.

UNIT - I

- 1 a. Distinguish between plane stress and plane strain idealizations.
 - b. Derive the expressions for equilibrium of a three dimensional problem in Cartesian coordinate system.
 - c. In a stress field, displacement components are as follows:

$$u = x^3 + 2y^2 + 3z - 5$$
; $v = x^2 + 3y^3 + 4z - 7$
 $w = x - 4y^2 + 2z^3 + 3$;

Find whether the compatibility conditions are satisfied.

- 2 a. Define generalized Hook's Law. Obtain the expressions for stress strain relationships in a three dimensional problem in Cartesian coordinate system.
 - b. In the absence of body forces, the state of stress at a point is given as follows:

$$\sigma_x = x + y \; ; \; \sigma_y = x - 2y \; ; \; \sigma_z = y \; ; \; \tau_{xy} = \alpha = f(x, y) \; ; \; \tau_{zy} ; \tau_{zx} = 0 \; .$$

Find α such that the system is in equilibrium.

UNIT - II

- 3 a. Define St Venant's Principle. Explain its significance in solution to engineering problems.
 - b. Check whether $\phi = Ax^2$ is a valid stress function. Mention the type of engineering problem solved by it.
 - c. A cantilever beam of uniform rectangular section is subjected to a point load P at its free end. The stress distribution to the problem is defined by $\sigma_x = A_{xy}$; $\sigma_y = 0$; $\tau_{xy} = B + Cy^2$; Determine the constants A, B and C. Also determine the strain components and find whether they are compatible.
- 4 a. What are Airy's stress functions? Mention their importance in solution to engineering problems.
 - b. Check whether $\phi = By^3$ is a valid stress function. Mention the type of engineering problem solved by it.
 - c. A simply supported beam of rectangular cross section is loaded with a point load at its mid span. Assuming a suitable stress function, obtain the expressions for stress components and strain components for the beam.

UNIT - III

- 5 a. What are compatibility equations? Explain their significance.
 - b. Derive the expressions for equations of equilibrium of a two dimensional system in polar coordinates.

- Assuming a suitable stress function, obtain the expressions for stress components of a beam of rectangular cross section subjected to pure bending.
- Obtain strain displacement relations for a two dimensional system in polar coordinates. 6 a.
- 10

8

b. Obtain the expressions for stress components of a thick cylinder subjected to internal and external fluid pressure assuming a suitable stress function. Obtain the variations in radial and tangential stresses across the thickness of cylinder when the external pressure is absent.

10

UNIT-IV

7 a. What are stress invariants? Write down the expressions for stress invariants. 4

b. Given stress at a point as follows:

$$[\sigma] = \begin{bmatrix} 10 & 4 & 8 \\ 4 & 20 & -6 \\ 8 & -6 & -30 \end{bmatrix} MPa$$

16

Find principal stresses, maximum shear stresses, octahedral stresses with respect to principal stresses and plane of intermediate principal stress.

8 a. What are hydrostatic and deviatoric stresses? Explain their significance. 4

b. Given strain at a point as follows $E_x = -0.004$, $E_y = 0.002$, $E_z = 0.006$, $\gamma_{xy} = -0.002$, $\gamma_{yz} = 0.003$, and $\gamma_{zx} = 0.004$, find principal strains, maximum shear strains, octahedral strains with respect to principal planes and plane of minor principal strain.

16

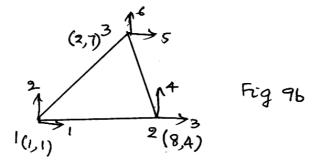

UNIT-V

Write the shape functions for a CST element. Sketch neatly the variations of shape function 9 a. N_2 .

4

For the CST element shown in Fig. 9 b, find the strain displacement matrix, element strains and element stresses. The nodal coordinates are in mm. The nodal displacement are $\{q\} = [0.001, 0.003, -0.002, -0.004, 0.002, 0.005]^T$ mm. Assume plane stress condition. Take; E = 200GPa and $\mu = 0.3$.

Derive the Jacobian matrix of a four noded quadrilateral element. c.

8

10a. Derive the shape functions of one corner node and one mid side node of a six noded triangular element.

6

b. Show that the convergence requirements of an isoparametric element can be satisfied if $\sum N_i = 1$.

8

Evaluate the following integral by Gauss Quadrature using three point approximation,

 $I = \int_{1}^{1} \cos\left(\frac{\pi x}{2}\right) dx$

6
