

## P.E.S. College of Engineering, Mandya - 571 401

(An Autonomous Institution affiliated to VTU, Belagavi)

**Second Semester, M.Tech. - Mechanical Engineering (MMDN)**

**Semester End Examination; June - 2017**

**Theory of Plasticity**

Time: 3 hrs

Max. Marks: 100

*Note: Answer FIVE full questions, selecting ONE full question from each unit.*

### UNIT - I

- 1 a. Write the Spherical and Deviatoric stress tensors starting from three dimensional stress tensor and state their significances. 5
- b. Given  $\sigma_{xx} = -5c, \sigma_{yy} = c, \sigma_{zz} = c, \tau_{xy} = -c, \tau_{yz} = 0, \tau_{xz} = 0$  where  $c = 1000 \text{ kPa}$ . Determine the Principal stresses, stress deviators, principal axes, maximum shearing stress and the octahedral stresses. 15
- 2 a. Discuss the following : 12
- i) Cubical dilation      ii) Octahedral strains      iii) Strain rate.
- b. The strain tensor at a point is given by,
- $$\varepsilon_{ij} = \begin{pmatrix} 0.002 & -0.005 & 0.003 \\ -0.005 & 0.003 & 0.002 \\ 0.003 & 0.002 & 0.004 \end{pmatrix}$$
- Determine the deviator and spherical strain tensors. 8

### UNIT - II

- 3 a. Stating the importance of yield criteria, discuss Tresca's and Von-Mises-Hencky's yield criteria. 12
- b. The state of stress at a point in material is given by
- $$\sigma_{xx} = 80 \text{ MPa}, \quad \sigma_{yy} = 100 \text{ MPa}, \quad \sigma_{zz} = 0, \quad \tau_{xy} = 60 \text{ MPa}, \quad \tau_{yz} = \tau_{xz} = 0,$$
- if the yield point of the material is 150 MPa, determine whether yielding occurs according to Tresca's and Mises-Hencky yield criteria. 8
- 4 a. Discuss the following with reference to yielding of materials :
- i) Yield criteria for an elastic materials      ii) Perfectly plastic materials
- iii) Yield criteria for anisotropic materials. 10
- b. Explain the Haigh-Westergaard stress space representation for yielding of materials. 10

### UNIT - III

- 5 a. Write the elastic and plastic stress-strain relations for the following materials :
- i) Rigid-perfectly plastic      ii) Rigid-strain hardening
- iii) Elasto-plastic with strain hardening      iv) Visco-elastic. 10

- b. State and explain Saint-Venant's theory for plastic flow phenomenon. 10
- 6 a. Discuss the experimental verification of Saint Venant's theory of plastic flow. 10
- b. Discuss the following in relation to plastic deformation of material :
- i) Plastic potential of a material                      ii) Prandtl-Reuss hypothesis. 10

#### UNIT - IV

- 7 a. Discuss the elasto-plastic recovery of residual stresses in beams. 10
- b. A cantilever beam of 100 mm wide, 120 mm depth and 4 m length is subjected to an end load of 5 kN. If the stress-strain curve for the beam material is given by  $\sigma = 700\epsilon^{0.2}$ , determine the maximum stress induced in the beam and its radius of curvature. 10
- 8 a. Discuss the following in respect of plastic torsion of circular bar :
- i) Elasto-plastic yielding                      ii) Full yielding. 10
- b. An aluminum rod 6.25 mm in diameter is drawn into a wire of 5.60 mm diameter. Neglecting friction between the rod and the dies, determine the drawing stress and the reduction in area when the yield stress for aluminum is 35 N/mm<sup>2</sup>. Calculate the tangential stress at the exit and the stresses in the rod at the entrance to the dies if the rod is extruded. 10

#### UNIT - V

- 9 a. Show that a plain strain condition exists in a 2-dimensional incompressible flow, and hence obtain principal strain equation. 8
- b. Deduce the Geiringer velocity equations for 2-dimensional incompressible flow. 8
- c. Write the conventions for the slip-lines. 4
- 10 a. Deduce the Hencky's equations of equilibrium for slip lines. 10
- b. State and explain the Hencky's second theorem for geometry of the slip-line method. 10
