## P.E.S. College of Engineering, Mandya - 571401

(An Autonomous Institution affiliated to VTU, Belgaum)
Seventh Semester, B.E. - Automobile Engineering
Semester End Examination; Dec. - 2015
Operations Research
Time: 3 hrs
Max. Marks: 100
Note: i) Answer any FIVE full questions, selecting at least TWO full questions from each part.
ii) Assume suitable missing data.
iii) Use of normal distribution table is permitted.

## PART - A

1 a. What is OR? What are the characteristics of OR?
b. Solve the following LPP by graphical method:

Minimize $\quad Z=600 x_{1}+400 x_{2}$
Subject to : $\quad 3000 x_{1}+1000 x_{2} \geq 24000$
$1000 x_{1}+1000 x_{2} \geq 16000$
$2000 x_{1}+6000 x_{2} \geq 48000$
Where $x_{1}, x_{2} \geq 0$
2 a. Define slack variable, feasible solution, optimum solution.
b. Solve the following LPP by Simplex method:

Maximize $\quad \mathrm{Z}=2 x_{1}+5 x_{2}+7 x_{3}$
Subject to: $\quad 3 x_{1}+2 x_{2}+4 x_{3} \leq 100$

$$
+4,13=100
$$

$x_{1}+4 x_{2}+2 x_{3} \leq 100$
$x_{1}+x_{2}+3 x_{3} \leq 100$
Where $x_{1}, x_{2}, x_{3} \geq 0$
3 a . What is degeneracy in transportation problem? How is it resolved?
b. A company has four factories from which is ships its products to four warehouses which are the distribution centres. Transportation cost/unit between various factories and warehouses are as follows:

|  |  | Warehouses |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  |
|  |  | W1 | W2 | W3 | W4 | Availability |
|  | F1 | 44 | 56 | 52 | 54 | 140 |
|  | F2 | 41 | 51 | 49 | 56 | 260 |
|  | F3 | 46 | 61 | 56 | 58 | 360 |
| F4 | 48 | 60 | 51 | 57 | 220 |
|  | Requirement | 200 | 320 | 250 | 210 |  |

$$
1 \cdot 0_{2}+100-10
$$

i) Obtain the initial basic feasible solution by Vogel's approximation method.
ii) Find the optimum transportation schedule and cost.
iii) Is the solution unique? If not, find the alternate solution.

4 a. An air freight company picks up and delivers freight where customers require. Company has two types of aircrafts X and Y with equal loading capacities but different operating costs. These are as shown below.

| Type of Aircraft | Cost per km in Rs. |  |
| :---: | :---: | :---: |
|  | Empty | Loaded |
| X | 1.00 | 2.00 |
| Y | 1.50 | 3.00 |

The present four locations of the aircrafts which the company is having are as shown below:
$\mathrm{J} \rightarrow \mathrm{X}, \mathrm{K} \rightarrow \mathrm{Y}, \mathrm{L} \rightarrow \mathrm{Y}, \mathrm{M} \rightarrow \mathrm{X}$
Four customers of the company located at A, B, C, D wants to transport nearly the same size of load to their final destination. The final destinations are at distances of 600, 300, 1000 and 500 km from loading points A, B, C and D respectively. Distance in km between location of aircraft and loading points are as follows:

|  | A | B | C | D |
| :---: | :---: | :---: | :---: | :---: |
| J | 300 | 200 | 400 | 100 |
| K | 300 | 100 | 300 | 300 |
| L | 400 | 100 | 100 | 500 |
| M | 200 | 200 | 400 | 200 |

Determine the optimum allocation.
b. A machine operator processes four jobs on his machine. The setup cost per change depends on the job currently on the machine and setup to be made according to the following table.

|  | To |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | A | B | C | D |
|  | A | $\infty$ | 4 | 7 | 3 |
|  | B | 4 | $\infty$ | 6 | 3 |
|  | C | 7 | 6 | $\infty$ | 7 |
|  | D | 3 | 3 | 7 | $\infty$ |

If each job is to be processed once and only once each week, how should the jobs must be sequenced on the machine?

## PART - B

5 a . Eight jobs each of which must go through the machines $\mathrm{A}, \mathrm{B}$ and C in the order CAB . Determine a sequence for the jobs and total elapsed time.

| Jobs | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Machine A | 4 | 6 | 7 | 4 | 5 | 3 | 6 | 2 |
| Machine B | 8 | 10 | 7 | 8 | 11 | 8 | 9 | 13 |
| Machine C | 4 | 6 | 3 | 3 | 4 | 9 | 15 | 11 |

Also calculate the total elapsed time and idle time for each machine.
b. Use graphical method to minimize the time needed to process the following jobs on the machine shown below. Calculate the total time needed to complete both the jobs.

| Job 1 | Sequence | A | B | C | D |
| :---: | :--- | :---: | :---: | :---: | :---: |
|  | Time (in hours) | 4 | 6 | 7 | 3 |
| Job 2 | Sequence | D | B | A | C |
|  | Time (in hours) | 4 | 7 | 5 | 8 |

6 a . Find the range of values p and q that will render the entry $(2,2)$ a saddle point in the following game:

$$
\text { A }\left(\begin{array}{ccc} 
& B & \\
p & q & 6 \\
p & 10 \\
6 & 2 & 3
\end{array}\right)
$$

b. Use the concept of dominance to sole the following game:

Player B

|  |  | I |  | II | III |
| :---: | :---: | :---: | :---: | :---: | :---: |
| IV |  |  |  |  |  |
|  | 1 | 3 | 2 | 4 | 0 |
| Player A | 2 | 3 | 4 | 2 | 4 |
|  | 3 | 4 | 2 | 4 | 0 |
|  | 4 | 0 | 4 | 0 | 8 |
|  |  |  |  |  |  |

b. A self service store employs one cashier at its counter. Nine customers arrive on an average of every 5 minutes while the cashier can serve 10 customers in 5 minutes. Assuming Poisson distribution for arrival and exponential distribution for service, find
i) The average number of customers in the system.
ii) The average number of customers in the queue or average queue length.
iii) The average time a customer spends in the system.
iv) The average time a customer waits before being served.

8 a. Differentiate between PERT and CPM.
b. An assembly operation involves the completion of 11 jobs. The job labels, the time required for completing each one and the necessary immediate predecessors of each job are shown in the table.

| Job | A | B | C | D | E | F | G | H | I | J | K |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Time (days) | 13 | 8 | 10 | 9 | 11 | 10 | 8 | 6 | 7 | 14 | 18 |
| Immediate <br> Predecessors | - | A | B | C | B | E | D, F | E | H | G, I | J |

i) Draw the network and determine the critical path.
ii) Also prepare a table of Free float and Total Float.
